"Identification and reconstitution of the origin recognition complex
from Schizosaccharomyces pombe.";
Proc. Natl. Acad. Sci. U.S.A. 96:12367-12372(1999).
-!- FUNCTION: COMPONENT OF THE ORIGIN RECOGNITION COMPLEX (ORC) THAT
BINDS ORIGINS OF REPLICATION. IT HAS A ROLE IN BOTH CHROMOSOMAL
REPLICATION AND MATING TYPE TRANSCRIPTIONAL SILENCING. BINDS TO
THE ARS CONSENSUS SEQUENCE (ACS) OF ORIGINS OF REPLICATION.
-!- SUBGELLULAR LOCATION: Nuclear.

(BY SIMILARITY).
                 nonreducing end of alpha-1,4-glucan.
-!- CATALYTIC ACTIVITY: UDP-glucose + { (1,4)-alpha-D-glucosyl} (N) = UDP + (1,4)-alpha-D-glucosyl} (N+1).
-!- ENZYME REGULATION: ALLOSTERIC ACTIVATION BY GLUCOSE-6-PHOSPHATE, AND PHOSPHORYLATION BY A CAMP-DEPENDENT KINASE.
-!- PATHWAY: Glycogen biosynthesis.
-!- SIMILARITY: BELONGS TO THE MAMMALIAN/FUNGAL GLYCOGEN SYNTHASE
FUNCTION: Transfers the glycosyl residue from UDP-Glc to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (BY SIMILARITY).

A Ortmeyer H.K., Marciani K.R., Hansen B.C.;
Monkey skeletal muscle glycogen synthase sequence.";
Submitted (JUL-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Transfers the glycosyl residue from UDP-Glc to the nonreducing end of alpha-1,4-glucan (By similarity).
-!- CATALYTIC ACTIVITY: UDP-glucose + {(1,4)-alpha-D-glucosyl} (N+1).
-!- ENZYME REGULATION: ALLOSTERIC ACTIVATION BY A CHAP DEPENDENT KINASE.
-!- BATHWAY: Glycogen biosynthesis.
-!- SIMILARITY: BELONGS TO THE MAMMALIAN/FUNGAL GLYCOGEN SYNTHASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (BY SIMILARITY).

                                                                                                                                                                              Brain Res. Mol. Brain Res. 38:191-199(1996).
--- FUNCTION: Transfers the glycosyl residue from UDP-Glc to the nonreducing end of alpha-1,4-glucan.
---- CATALYTIC ACTIVITY: UDP-glucose + {(1,4)-alpha-D-glucosyl}(N) = UDP + {(1,4)-alpha-D-glucosyl}(N+1).
---- BNZYME REGULATION: ALLOSTERIC ACTIVATION BY GLUCOSE-6-PHOSPHATE, AND PHOSPHORYLATION BY A CAMP-DEPENDENT KINASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryota, Metezoa; Chordata; Craniata; Vertebrata; Buteleostomi; Mammalia; Butheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. -!- FUNCTION: One gap junction consists of a cluster of closely packed pairs of transmembrane channels, the connexons, through which materials of low mw diffuse from one cell to a neighboring cell.
-!- SUBUNIT: A connexon is composed of a hexamer of connexins.
-!- SUBCELPULAR LOCATION: Integral membrane protein.
-!- TISSUE SPECIFICITY: Highly expressed in lung.
-!- SIMILARITY: BELONGS TO THE CONNEXIN FAMILY. ALPHA-TYPE (GROUP II)
                Gaps

Immun. 62:5027-5031(1994).
-!- CATALYTIC ACTIVITY: N(6)-(L-1,3-dicarboxypropyl)-L-lysine + NAD(+)
+ H(2)O = L-lysine + 2-oxoglutarate + NADH.
SUBCELLULAR LOCATION: Integral membrane protein.
INSSUE SPECIFICITY: Mostly in heart, and in the whole embryo,
liver, stomach, and pectoral muscle.
SIMILARITY: BELONGS TO THE CONNEXIN FAMILY. ALPHA-TYPE (GROUP II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- PATHWAY: Lysine biosynthesis; alpha-aminoadipic acid pathway;

-!- FUNCTION: One gap junction consists of a cluster of closely packed pairs of transmembrane channels, the connexons, through which materials of low mw diffuse from one cell to a neighboring cell.
-!- SUBGNIT: A connexon is composed of a hexamer of connexins.
-!- SUBGELIDIAR LOCATION: Integral membrane protein.
-!- SIMILARITY: BELONGS TO THE CONNEXIN FAMILY. ALPHA-TYPE (GROUP II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mitochondrion.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 27150, Application US/09252991A

Sequence 27150, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLBIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT PELLOGATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 27150
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 2

Sequence 4, Application US/09099125A
Sequence 4, Application US/09099125A
Patent No. 5916760
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Woronicz, John
TITLE OF INVENTION: IKK- Proteins, Nucleic Acids and Methods
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
ADDRESSEE: SCIENCE & TECHNOLOGY LAW GROUP
STREET: 268 BUSH STREET, SUITE 3200
CITY: SAN FRANCISCO
STATE: CALIFORNIA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 30; DB 2; Length 745;

Sequence 13, Application US/09635872A

Patent No. 6534300

BERERAL INFORMATION:
APPLICANT: CANFIELD, WILLIAM

TITLE OF INVENTION: METHODS FOR PRODUCING HIGHLY PHOSPHORYLATED LYSOSOMAL HYDROLASES

TITLE OF INVENTION: METHODS FOR PRODUCING HIGHLY PHOSPHORYLATED LYSOSOMAL HYDROLASES

TITLE OF INVENTION: METHODS FOR PRODUCING HIGHLY PHOSPHORYLATED LYSOSOMAL HYDROLASES

CURRENT RAPELICATION UNMBER: US/09/635,872A

PRIOR APPLICATION NUMBER: 60/153,831

PRIOR APPLICATION NUMBER: 60/153,831

PRIOR FILING DATE: 1999-09-14

NUMBER OF SEQ ID NOS: 52

SOFTWARE: PATENTIN VERSION 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 13, Application US/09636077A

Patent No. 6537785

GENERAL INFORMATION:
TITLE OF INVENTION: METHODS OF TREATING LYSOSOMAL STORAGE DISEASE
FILE REFERENCE: 195612030

CURRENT APPLICATION NUMBER: US/09/636,077A

CURRENT PILING DATE: 1990-09-10

PRIOR APPLICATION NUMBER: 60/153,831

PRIOR APPLICATION NUMBER: 60/153,831

Patent No. 5426181

GENERAL INFORMATION:
APPLICANT: Lee, Tae Ho
APPLICANT: Lee, Gene W.
APPLICANT: Vilcek, Jan
TITLE OF INVENTION: Cytokine-Induced Protein, TSG-14,
TITLE OF INVENTION: DNA Coding Therefor and Uses Thereof
NUMBER OF SEQUENCES: 5
CORRESPONDENCE ADDRESS:
  Indele
